

Smart Digital Meter for Home & Industry

Introduction

ChipGlobe is developing an advanced Smart Digital Meter solution for accurate, real-time electricity consumption monitoring. A functional prototype has already been successfully built and validated.

Technology

The system measures real-time voltage and current, calculates power ($P = V \times I$), and integrates it over time to determine energy consumption in kilowatt-hours (kWh). It is based on Infineon's TLI4971, the most accurate coreless magnetic current sensor available.

Prototype Status

A working DC Smart Meter prototype exists, including real-time measurement and processing. It is ready for productization, with final industrialization and certification pending.

Key Advantages

High accuracy, compact design, non-intrusive measurement, scalability, and readiness for smart grid integration.

Market Relevance

Highly suitable for countries like Bangladesh, supporting large-scale smart metering, improved billing accuracy, and grid transparency.

Track Record

ChipGlobe has successfully brought hardware products to market, including the SQ Panel air quality sensor, demonstrating strong execution capabilities.

Next Steps

Finalize design, obtain certifications, pilot deployment with government partners, and scale manufacturing.
